Math 9 Fall 2022 — MATLAB Homework #2
MATLAB matching game!
Corresponding Outcomes: EO3, EO5, GOMa1, GOMA2

Instructions
Part A: You will be given 20 total cards. Each of the 20 cards assigns a value to a variable. Ten of the cards assign a value to d, and ten of them assign a value to z. Each d variable has the same value as exactly one of the z variables. Your job is to match the cards. For example, if card 1 defines d = [1, 2, 3, 4] and card E defines z = [1, 2, 3, 4], then card 1 matches card E. In a group of 1-3 students, match up the cards. This is good practice for our P&P Quizzes and Checkpoints, so try to use the computers as little as possible (since you can't use them during the exams). To submit this assignment, put the names of your group members at the top of a sheet of paper, and list how the cards match. For example, your answer might look like:

```
card 1 = card E
card 2 = card A
```

and so on. No additional justification is necessary.

Advice: The `randi()` function shows up on this homework, even though we have not seen it in our lectures yet. You will need to read the documentation for it to understand what it does! Don't forget about the `help` command.

Part B: Pick *any* question or concept you've seen in Math 9 so far and imagine you are explaining to a friend who has never coded before how you were able to solve the problem or understand the concept. Write this explanation on the Ed Discussion thread for this homework. Alternatively, if one of your classmates writes an explanation that really clarifies things for you, write a comment letting letting them know what in their explanation made it click for you. (Only one post per group needs to be made, but all group members are welcome to make their own posts and comment.)
